

# Streamwise-traveling waves in a pipe flow: experimentally assessing the turbulent drag reduction

F.Auteri, A.Baron, M.Belan, A.Bertolucci, M.Quadrio

Dip. Ing. Aerospaziale Politecnico di Milano

ETC XII – Marburg

# Outline

- 1 Background
- 2 Experimental setup
- 3 Results

# Outline

- 1 Background
- 2 Experimental setup
- 3 Results

# Spanwise wall oscillation

Quadrio & Ricco, JFM '04

$$w(x, y = 0, z, t) = A \sin(\omega t)$$

- Large reductions of turbulent friction
- Unpractical

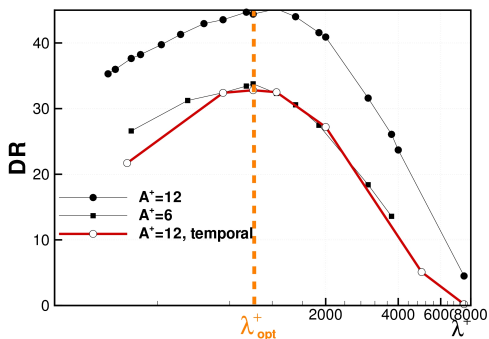

# The oscillating wall made stationary

Quadrio & Viotti, ETC XI

$$w(x, y = 0, z, t) = A \sin(\kappa x)$$

- Existence of an **optimal wavelength**  
 $\lambda_{opt} = U_w T_{opt}$
- Can be implemented as a **passive device**  
 (sinusoidal riblets)

# The traveling waves: a natural extension

## Purely temporal forcing

The **oscillating** wall:

$$w = A \sin(\omega t)$$

- Infinite phase speed

## Purely spatial forcing

The **steady** waves:

$$w = A \sin(\kappa x)$$

- Zero phase speed

## Combined space-time forcing

The **traveling** waves:

$$w = A \sin(\kappa x - \omega t)$$

- Finite phase speed  $c = \omega/\kappa$

# Results from DNS (plane channel)

Quadrio et al., JFM 2009

# How much power to generate the waves?

- Power  $\sim w \partial w / \partial y|_{y=0}$
- Upper bound to energetic cost
- Similar to drag reduction map!
- Ratio of energy save to cost up to **30:1**
- Up to 25% net energy save

# Motivation for a laboratory experiment

Devise a **proof-of-principle** experiment to:

- **confirm** DR phenomenon
- improve understanding of the traveling waves
- explore further the parameter space ( $Re$ ,  $A$ )

# Outline

- 1 Background
- 2 Experimental setup
- 3 Results

# Main design choices

- Cylindrical pipe
- Spanwise wall velocity: **wall movement**
- Temporal variation: **unsteady** wall movement
- Spatial variation: the pipe is sliced into thin, independently-movable **axial segments**
- Friction is measured through pressure drop

# SHOW MOVIE HERE!

# The pipe

A closed-circuit water pipe

# The rotating segments

60 slabs with 6 independent motors

# The transmission system

Shafts, belts and rotating segments

# The control system

- Motion of the slabs is feedback-controlled
- Tachometric sensors to feed back angular speed
- Fully automated test management

# Flow parameters

- Working fluid is water
- $U_b = 0.085$  m/s
- $R = 0.025$  m
- $Re = 4900$
- $Re_\tau = 180$
- System degassed after filling
- Temperature and flow rate are continuously monitored
- Reference pressure drop  $\approx 7$  Pa!

# Outline

- 1 Background
- 2 Experimental setup
- 3 Results**

# Experimental conditions

# Drag variation

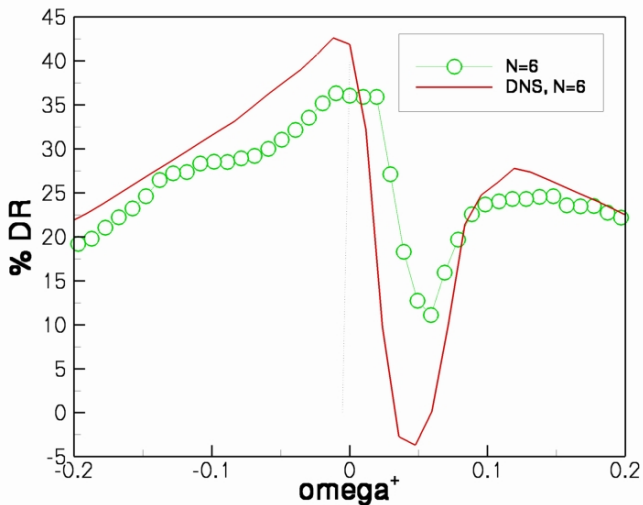

# Drag variation

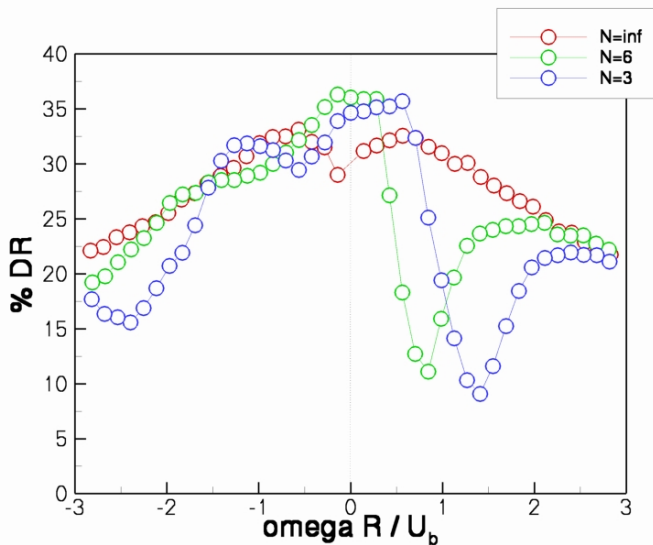

# Comparison with DNS (plane channel)

Inner units

# Drag variation

# Drag variation

# Comments

We do not expect quantitative agreement between DNS and experiment:

- Spatial transient
- Cylindrical vs planar geometry
- Difference in GSL
- Difference (small) in  $Re$  and  $A$
- **Waveform effects**

# Conclusions and outlook

- DR is confirmed
- A large 37% is measured at intermediate intensity
  
- Describe effects of spatial discretization
- Cartesian vs cylindrical
- Explore parameter space
- Scaling of DR

# THE END...

# Understanding the physics

The lifetime  $T_\ell$  of turbulent structures

# Unsteadiness in the convecting reference frame

## Oscillating wall

- Forcing on a timescale  $\gg T_\ell$  does not yield DR
- Timescale: oscillation period  $T$

# Unsteadiness in the convecting reference frame

## Oscillating wall

- Forcing on a timescale  $\gg T_\ell$  does not yield DR
- Timescale: oscillation period  $T$

## Traveling waves

- Forcing on a timescale  $\gg T_\ell$  does not yield DR
- Timescale: oscillation period  $\mathcal{T}$  as seen in a **convecting reference frame**

$$\mathcal{T} = \frac{\lambda_x}{U_w - c}$$

- $U_w$ : convection velocity at the wall
- $c = \omega/\kappa$ : phase speed

# How spanwise forcing really works

Quadrio et al., JFM 2009

# One step back

Extending the laminar Stokes solution

- Laminar flow
- Transverse, alternating boundary layer
- Qualitative similarity

$$w(y, t)$$

$$w(y, x)$$

$$w(y, x - ct)$$

# The generalized Stokes layer

An analytical approximate solution

$$w(x, y, t) = A \Re \left\{ C e^{2\pi i(x-ct)/\lambda_x} \text{Ai} \left[ e^{\pi i/6} \left( \frac{2\pi u_{y,0}}{\lambda_x \nu} \right)^{1/3} \left( y - \frac{c}{u_{y,0}} \right) \right] \right\}$$

- $\delta_{GSL} \ll h$
- Neglect streamwise viscous diffusion
- Threshold velocity to discriminate flow regimes

# Using the GSL solution

Thickness of the GSL
